MONOLOGISATION AS A QUOTING PRACTICE
Obscuring the journalist’s involvement in written journalism

This paper explores a particular aspect of journalistic quoting, monologisation. During monologisation, the interactive turn exchange between the journalist and the interviewee is simplified for the article, which is mainly conducted by obscuring the role of the journalist in the original spoken discourse. As a result, the quotations appear to be unprompted, continuous utterances by the interviewee, which in turn has seminal consequences for the interpretation of the quotation. This paper will demonstrate that monologisation is an effective means for journalists to steer the reading of the article and to include their own points of view without breaking the professional rule that journalism must separate facts from opinions. The results of this study are based on a comparison between two types of empirical data; recordings of journalistic interviews on the one hand, and published articles on the other. This study will focus on one particular type of journalistic interview that has been largely neglected in prior research along with its specific quoting practices: The interviews were conducted by the journalists in order to collect raw material for written journalistic items, published either in print or electronic form. This paper will show that interviews of this type involve highly diverse and mutually adaptive interaction, contrary to the clearly structured question-answer interviews that are used as sound bites in television news items and have thus far remained the primary focus of research on both journalistic interviews and quoting processes. The notion of monologisation could be applied in various domains where an interview is converted into a written account, such as research interviewing and police interrogations.

KEYWORDS direct speech; quotations; journalistic interviews; monologisation; quoting practices; version analysis; print media

1. Introduction

Journalistic interviews are a common means for journalists to gather raw material for their articles (for example, see Ekström 2001), which frequently utilise direct quotations drawn from these interviews (see Ekström 2006; Haapanen & Perrin forthcoming 2017). In this paper, I will examine the quoting process that begins with an oral interview and results in the finalised, published article with one or more direct quotations. Through this process, the journalist re-contextualises spoken discourse into a written form. My goal is to explore how this ostensibly ”direct” relationship of the original spoken and the final written discourse is subject to changes, both in terms of its linguistic form and the different types of situated meanings (for example, see Linell 1998, 154-155; Perrin 2013, 28). More specifically, I will examine a particular aspect of this re-contextualisation that I have termed monologisation.

During monologisation, the interactive turn exchange between the journalist and the interviewee(s) is modified – often simplified in several respects, if not totally concealed – for the article and this is conducted, above all, by obscuring the involvement and influence of the journalist in the original spoken discourse. As a result, the quotations appear to be unprompted and continuous utterances by the interviewee. Thus, the regular understanding of the words dialogue and monologue succeeds in reflecting the contrast between a journalistic interview as a discourse with relatively frequent turn-taking by two (or more) participants and a published, edited quotation as a discourse by a single language user. (See also Haapanen in press 2016a, section 3.4).
As the empirical data of this paper will show, interaction between the journalist and the interviewee in the journalistic interview is substantially characterised by cooperativeness and equality. Since any single stretch of discourse receives its situated meaning in relation to its interactionally accomplished contexts (for example, see Linell 2009), deliberate modification of the impression that is created of original interaction, such as simplification, provides the journalist with substantial means for controlling the interpretation of the readers. In other words, the journalist can exploit the dialogue and common understanding emerged in the interview for his or her own purpose (similarly, for example, Eriksson 2001; Kroon Lundell & Ekström 2010; Nylund 2003). Thus, the notion of monologisation also adds on to the discussion of power relations in journalism.

In Section 2, I will begin by explaining the background of the notion of monologisation and reviewing the related studies. Additionally, I will highlight the intrinsic differences between various types of journalistic interviews. In section 3, I will introduce the data and methods of the present study. I will then elaborate the concept of monologisation in three consecutive subsections of Section 4, which also particularise the nature of such journalistic interviews conducted to gather raw material for journalistic articles. In Section 5, I will discuss the societal significance of the practice of monologisation, and finally, in Section 6, I will summarize and discuss the findings and conclude that the notion of monologisation is not only interesting in theorizing the journalistic work practices but also a key to a critical reading of the media of our time.

2. Background and related studies

My conceptualisation and understanding of monologisation has arisen from two primary conclusions of my earlier research: Firstly, version analysis indicated that there is an intrinsically complex relation between journalistic interviews and the quotations that are based on them (Haapanen in press 2016a). Secondly, stimulated recall interviews suggested that this complexity was explained by the journalists’ deliberate and overarching attempt to fulfil the objectives of the article when formulating quotations, rather than sticking to the commonly presented idea that the quotations must be ‘direct’, that is, word-for-word, or at least meaning-for-meaning, testimonies of the original utterances (Haapanen in press 2016b). What remained unexplained when relating the text analytical findings (result 1) to the journalists’ self-reflections (result 2) was the phenomenon that is under discussion in this paper: monologisation. It is noteworthy that despite the indication in my empirical data that monologisation is a common and mundane practice, journalists themselves did not encapsulate and/or conceptualise this particular procedure when discussing their work process. Therefore the close scrutiny and articulation of this particular practice could provide also practitioners with added value.

Monologisation can be considered as a blind spot also in research on the production of media items. While a somewhat similar phenomenon has briefly been described in earlier research, it has not been afforded comprehensive consideration (Clayman 1990; Eriksson 2006, 2011; Kroon Lundell and Ekström 2010; Nylund 2006 and 2011; Perrin 2013). Previous research has predominately focused on television news productions, arguing that the majority of soundbite quotes are “isolated answers”, meaning that answers to specific questions are presented independently without the questions. This creates, first of all, the impression that the comments are made on the speaker’s own initiative. Furthermore, removing the journalist’s original question also changes the meaning of the quoted utterance, as pointed by Ekström (2001, 596):

The widespread practice of divorcing answers from questions give news journalists considerable leeway, for example, to ask leading questions and otherwise provoke answers which may then be presented to the public as the interviewee’s spontaneous comments.

However, Ekström’s research had no access to the original interview situations to assess the true nature of the original turn exchange. Nevertheless, Ekström presupposed and simultaneously renewed
the perception that a journalistic interview is fundamentally an exchange of questions and answers and that quoted passages are inherently answers to questions. This notion might be valid in several types of journalistic interviews.

Firstly, there are press conferences, in which multiple journalists, one after another, present their question for an interviewee(s) and are unlikely to have an opportunity for a follow-up question. This naturally leads to well-prepared – and often more complex – formulation of the questions. (For example, Clayman 1993, Eriksson & Östman 2013). Secondly, there are so-called news interviews, which are relatively long stretches of un-edited turn-taking used as a one segment of a news program or the overarching format for the program as a whole (Clayman & Heritage 2002, 1). In most news interviews a single journalist is in charge on the questioning at any given time, and this allows her or him the freedom to ask follow-up questions. The news interviews are among the most thoroughly researched forms of broadcast talk (for example, see Clayman & Heritage 2002, Fetzer 2002, Fetzer & Weizman 2006, Harris 1991, Hutchby 2005, 2006, Lauerbach 2007, Montgomery 2007), and the field has shown signs of diversification from the study of general features to more specialized practices geared to particular subgenres (Clayman & Romaniuk 2011). Thirdly, there are such journalistic interviews that are incorporated as soundbite quotes into television or radio news items (for example, see Ekström 2001; Kroon Lundell & Ekström 2010, Nylund 2006 and 2011; Perrin 2013). To reduce unexpected and/or incoherent communication, these interviews conducted in front of the camera or microphone tend to precede so-called pre-interviews. These refer to a process during which a journalist contacts prospective interviewees, listens to what they know, and assesses if they are capable of delivering compact and smooth quotes. Although these pre-interviews are not much studied, it is probable that they often emerge in more informal and inconsistent way than the filmed or tape-recorded interviews with fixed lists of preconceived questions. (Nylund 2011.) [FOOTNOTE 2]

After all above-mentioned, one common – yet less studied – type of a journalistic interview remains unaddressed, namely a journalistic interview conducted to gather raw material for a journalistic article (abbreviated henceforth “for JA”). Since the emergence of the interview varies depending on the medium (Quinn 2005, 102), in the journalistic interviews for JA, the interaction between the journalist and the interviewee is, in fact, much more diverse and complex than what could be assumed on the basis of the findings of television-focused research (for instance, see Clayman & Heritage 2002, 95).

These characteristics of journalistic interviews for JA is the very reason why I argue that in written journalism, the phenomenon of monologisation is not only more diverse but also more significant than in audio-visually broadcasted media: Journalistic interviews conducted for JA are relatively long, unstructured, and informal, as will be illustrated below (see also Haapanen in press 2016a). Therefore, the process of constructing a concise and pertinent article out of such “loose” raw material requires – and simultaneously enables – more substantial editing than a television news production. In the latter, journalists are advised, for example, to limit the length of their interviews to five minutes and to prevent the interviewee from rambling (Gormly 2004, 250–255).

3. Data and methods

This paper draws from two empirical data sets, which comprise recordings of authentic interviews conducted by several journalists (data set 1) and the published articles written by these same journalists on the basis of their interviews (data set 2). All the articles were published in Finnish media between 2012–2014.

To begin with, there were no research results indicating that a particular title, media genre (for example, national/regional newspapers, women’s magazines, bulletins) or article type (for example, news, profiles, features, reportages) would be a decisive factor in the making of quotations. Therefore, I considered the journalistic interview as an appropriate starting point for my data collection. First of all, a journalistic interview is clearly one of the conventionalized premise(s) for information gathering in journalistic work (Ekström 2006: 23). Most commonly it is an oral, one-to-one interview that is performed in a somewhat conventional way and, despite the variations in execution, has an explicit purpose – most obviously, to gather information for an article – as well as a fixed overall structure and predetermined general participant roles. Apart from one-to-one interviews, I also included a few press conferences to my data, because they are the other common way of collecting data for articles (Erikkson & Östman 2013). This expansion also makes my research more comparable to the existing studies on quoting in written journalism, since they also consist of press conferences (see Johnson Barella 2005, Lehrer 1989).
For the interviewees of these interviews and press conferences, I did not set any prerequisites. Although the identities of the interviewees might influence quoting practices, I assume that this interplay is more complex than, for example, Davis’s (1985, 47) much cited insight “the higher the status of a speaker, the more direct the presentation” suggests (cf. a comparison between two interview-article pairs with the President of Finland, Sauli Niinistö, see Haapanen in press 2016a, 3.1).

Thus, the first data set consists of 20 recordings of authentic journalistic interviews and press conferences from 16 experienced journalists who work as either full-time employees, or as freelancers for various established publications. I asked the journalists to record one or two interviews, but I did not disclose the exact objective of my study. The length of these interviews varied considerably, ranging from less than 2 minutes to 1 hour 45 minutes. I have written permissions from these journalists to use these recordings for research purpose.

The second data set consists of 21 published articles that were based on the interviews and press conferences in the first data set. The articles could be categorised as news, profiles and fact-focused interviews, although there exists no clear-cut typology of journalistic articles (however, a typology of news articles, see Vandendaele, De Cuypere, and van Praet 2015). These articles were published in newspapers, magazines, business-to-consumer magazines (“B2C magazines”), and web publications.

After collecting the data, a rough transcript of each recording was prepared. Subsequently, the passages that served as the basis for the quotations in the published articles were transcribed in further detail. In the examples presented in this paper, I have marked pauses, points of overlap onset, cut-offs, and substantially rising intonation with the following symbols: (.) [- and ?, respectively. All the data were originally in Finnish. For the purposes of this paper, the data excerpts are presented in English, while the original Finnish versions are attached as an appendix. To maintain the anonymity of my informant-journalists and the interviewees mentioned in their articles, all the names and other identifying characteristics have been changed, and I will consistently refer to the informant-journalists as well as the interviewees by the feminine pronoun regardless of their gender.

The analytical method applied to these two data sets is version analysis (in media linguistics, see Perrin 2013, 62), which is a method of analysing data to reconstruct the changes that occur in the linguistic features of two different versions of data. In my research design, I will first examine the diverse nature of journalistic interviews in terms of interaction. Subsequently, I will analyse how these interactional and mutually constructed features are – or are not – reflected in the quotations of their new co-text and context.

4. Types of monologisation practices

In this section, I will begin by introducing the most straightforward monologisation practices in which the journalistic interview for JA consists of questions and answers, with both elements reproduced to some extent in the published article. I will then proceed to discuss more complex practices in which the journalistic interview for JA comprises both questions and answers, but the questions are omitted from the published article. Finally, I will cover the most common and yet the most complex composition of journalistic interviews for JA. In these interviews, the turn exchange between the journalist and the interviewee is relatively “equal”, which could be best described through negation: These types of interview situations involve diverse interaction, but no clearly shaped question-answer exchange. This type of interaction is then predominately obscured through monologisation, generating changes in both the meaning of the quoted content and the impression disseminated about the original interaction between the journalist and the interviewee.

4.1 Original Turn-Exchange is Reproduced but Reduced

Human social interaction is known to be sequentially organised through turn-taking (for example, see Sacks et al. 1974). A journalistic interview is an institutionalised form of human interaction that occurs between a journalist and an interviewee. According to Heritage, (1998, 7), this institutional aspect constrains the participants and causes “dramatic differences” as compared to mundane conversation:

In conversation, topics emerge freely and in a variety of ways, the participants are free to make diverse contributions to the subject at hand and anyone can initiate a new line of departure. In
the news interview, by contrast, the participants are fundamentally constrained. Interviewers restrict themselves to questioning and interviewees restrict themselves to answering the interviewers’ questions, or at least responding to them. (Heritage 1998, 7.)

It must be noted that Heritage’s observation concerns first and foremost audio-visually broadcasted (live) news interviews. However, as no similar comparison exists between mundane conversation and journalistic interviews for JA, I adopt Heritage’s claim as the basis for the structure of my analysis. Against this initial description, I will begin composing an understanding of journalistic interviews for JA.

I will first examine a case where the journalist poses a question and the interviewee answers it, and this question-answer sequence is exposed in the article as well. The example (“Dancer”) below is extracted from a profile article published in a magazine. The subject is a dancer (Korhonen) and her work.

Example 1A. “Dancer” (profile article / published in a magazine)

But what does the performance convey in practice? Who is Korhonen on stage?
"My approach has always gone towards not assuming a role."

Example 1B below shows the particular portion of the journalistic interview that acts as the basis of the extract above, demonstrating the relationship between the two. The left-hand column contains the transcript of the interview, whereas the right-hand column presents the quotation and the preceding text as they appeared in the journalistic article. The corresponding sections are placed on the same row.

Example 1B. “Dancer” (Journalistic interview versus published article)

“My approach has always gone towards not assuming a role.”
Even a cursory review of the comparison presented in Example 1B reveals that two core elements of the interview are reproduced in the article. The first is the journalist’s question on row 3 (without quotation marks, which is a common convention in the field of written media) and the second is the interviewee’s answer on row 5. While the question has undergone a relatively extensive rewording, the answer is re-contextualised on a more verbatim basis, although some considerable modifications have occurred.

These modifications have simplified and obscured the process-like nature of the original discourse in several ways, as analysed below. Firstly, the interview discourse that was jointly produced contained a considerable number of continuers (\(mm\)) by the journalist (row 5), which serve to signal the interviewee to continue her turn (for instance, see Schegloff 1982). In the quotation, these discourse particles are deleted, which creates the impression that the interviewee has originally uttered her comment in a continuous and spontaneous way.

Secondly, expressions of word search and planning, for example, the planning device ‘like’ (originally, \(niinku\)) and repetitions of words, are deleted from both the answer and the question. Furthermore, word forms typical of spontaneous spoken language are edited to accommodate the forms of the standard language. However, there is one exception: On row 5, in its original Finnish form, the quotation contains the pronoun \(mun\) (pro \(minun\) ‘my’). These types of short pronoun forms are typical of spoken discourse and indeed the interviewee uses them throughout her speech in the interview, but they are much more distinctive in the written format. This one occurrence of “mimicking” can be interpreted as a deliberate means to create an illusion of spoken language in the quotation (Haapanen 2011).

Thirdly, the interviewee begins her utterance (row 5) with a discourse particle translated as ‘well’ (\(no\) in Finnish), which signifies both a shift in topic and the fact that the speaker is reserving a longer turn for herself to speak of this new topic (Vepsäläinen, in preparation). This discourse particle is absent from the quotation, which in turn reduces the reader’s possibilities to deduce the original function of the quoted passage.

Finally, the interview discourse preceding the quoted section also contains many interactional elements that are likewise concealed from the reader. Firstly, on row 1, the journalist provides the premise of her question. This background is omitted from the article entirely. Then, following her main question on row 3, the journalist presents one more question (row 4), as if doubting her ability to make her point clear. This procedure-related “metaquestion” and the interviewee’s answer are likewise eliminated. (Furthermore, there is an additional question [row 2] in the article that does not exist in the interview. I will return to this point later in this section.)

To summarise, despite these obvious modifications in the linguistic form of the utterances of both the journalist and the interviewee, the represented section reflects the chronology of the authentic turn-taking that it is based on. However, as many elements of the original interaction in this section (such as the continuers of the journalist) and around this section are absent (for example, the agenda setting and the self-reflection), the original participatory roles, especially that of the journalist’s, are dispelled and, similarly, the intrinsic complexity of the original interview interaction is concealed from the reader.

It should also be kept in mind that journalistic articles are not protocols of the course of the oral interviews they are based on, but are dramaturgically independent stories (Haapanen 2016). For example, if a published article contains a question leading to the quotation, this does not necessarily mean that this particular question was presented in the actual interview, let alone in its exact linguistic form. The first question of the published article on row 2 is a case in point. As this question had no equivalent in the interview, it was perhaps formulated for narrative reasons, such as to create a background context for the next question in the journalistic article (row 3).

Interestingly, a complete, faithful reproduction of the original interaction, even to the extent of Example 1, is very rare in the collected data (the same applies to broadcasted news, see Ekström 2001).

4.2 Questions Omitted, Answers Reproduced Without “Answer-ness”

This subsection discusses a common monologisation practice that involves a quotation (and in this example, also an indirect quotation) drawn from the interview, while the journalist’s preceding question
is edited out. This results in considerable distortion regarding the way the original interaction between the journalist and the interviewee is reflected and constructed in the article.

Example 2 (“Feedback”) is drawn from a newspaper article that discusses a service launched by a particular public library to provide feedback for desk drawer writers. Again, I will first present the extract of the published article (Example 2A) and then complement it with the transcript of the interview between the journalist and the interviewee (librarian Numminen) in Example 2B.

Example 2A. “Feedback” (news article / published in a regional newspaper)

According to Numminen, people expect a little too much of evaluation services, meaning that in actuality, one is supposed to read a long piece of text and give concrete advice on how to get it published.

"If there are about a hundred pages of text to be evaluated, I read maybe thirty pages, plus a few excerpts from underneath the most interesting headings."

Example 2B. “Feedback” (Journalistic interview versus published article)

<table>
<thead>
<tr>
<th>Journalistic interview (transcript)</th>
<th>Published article (excerpt)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><strong>JO</strong>: So in what way do customers receive this feedback or with what kind of expectations do they come here</td>
</tr>
<tr>
<td>2</td>
<td><strong>IN</strong>: well some ha- some expect a little too much that we'd direct (.) that we'd read some immensely long piece of text all the way through and (.) advise how it will get published (.) however we prefer to read the brief (.) brief excerpt of the text and give an evaluation of that</td>
</tr>
<tr>
<td>3</td>
<td><strong>JO</strong>: What is brief (.) in this case</td>
</tr>
<tr>
<td>4</td>
<td><strong>IN</strong>: well from one particular (.) hundred plus pages long text I read thirty pages (.) and then (.) browsed through it and read a few interesting headings (.) or rather a couple of paragraphs with interesting headings, not just the headings of course</td>
</tr>
</tbody>
</table>

"If there are about a hundred pages of text to be evaluated, I read maybe thirty pages, plus a few excerpts from underneath the most interesting headings."

The interview turn-taking is characterised by the journalist’s initiative and interrogative role. However, when the journalist wrote her article based on this interview, her own role as the initiator and interrogator was predominately concealed from the reader. The journalist’s question on row 1 (So in what way do customers receive this feedback…?) is excluded from the article. The answer to that question on row 2 is moulded into an indirect quotation where the content of the passage is clearly attributed to the interviewee (According to Numminen…), but the linguistic form does not necessarily follow the original utterance word-for-word. However, this particular indirect quotation does not reveal to the reader who took the initiative for the quoted passage and what this initiative might have been.

On row 3, the journalist produces a follow-up question to clarify a qualifier that the interviewee used (the length of brief). The interviewee answers this follow-up question (in the left-hand column of row 4), and this answer is reproduced as a direct quotation in the article (in the right-hand column of row 4). Nonetheless, the formulation of the beginning of the quotation is rather different from the beginning of the answer. Among other aspects, the discourse particle “well” (originally no in Finnish) is once again deleted. Furthermore, the issue is presented as a generic example of work practices in the quotation, although the utterance refers in the interview to the particular case under discussion. As a
consequence, from the published quotation alone, the reader cannot deduce the type of turn-taking that it is based on. And as the lay definition of an interview definitely rests on the assumption of asking and answering, a reader who attempts to “de-code” the questions might devise guesses such as What have people’s expectations of this service been? and How many pages does one read as a sample?. As can be observed in Example 2B, these guesses are far from the actual questions posed in the interview.

Finally, in terms of the linguistic features of the interaction, Example 2B demonstrates several deviations between the original and the re-contextualised discourse. Compared to the journalist in Example 1, the journalist in Example 2 does not steer the conversation by using continuers or any verbal discourse particles. [FOOTNOTE 5] Despite this, the process-like features, such as the slight confusion as to the headings on row 4, are “corrected” in the quotation, and the flow and register of the text is standardised.

To summarise the main findings of this subsection, the journalists’ initiative, interrogative, and participatory role in the quoted-to-be discourse is edited out and the responsive nature of the quoted-to-be turns of the interviewee is concealed. In the next subsection, I will discuss a case where the original interaction in the journalistic interview for JA is more complex than what we have seen in Examples 1 and 2. This further extends the consequences of monologisation.

4.3 An Equal Turn-Exchange is Dispelled

In the previous examples, the journalists presented (relatively) clear questions and the interviewees answered them (see Examples 1B and 2B), even though many features indicating that they were responses, their answer-ness, were subsequently deleted from the quotations. However, the course of a journalistic interview for JA does not always, or even often, proceed in such a well-ordered and structured way. Instead, interviews that are conducted “only” to gather information but not to be broadcasted (see broadcasted news interviews treated in Clayman & Heritage 2002), most commonly consist of joint production and reciprocal negotiation (cf. Nylund 2006, 212–213, 481). Furthermore, interviewee-driven journalistic interviews are not exceedingly rare, either. That is to say that the interviewee may digress away from the topic introduced by the journalist, or even come up with a different (sub)topic on her own.

I will illustrate these observations with an interview-article pair (Example 3, “Engineer”) drawn from a business magazine. The article discusses the company and career of a Chinese immigrant in Finland who speaks Finnish as a second language.

Example 3A. “Engineer” (mini profile / published in a business magazine)

At Midsummer of 1994, Wang’s life changed completely when she arrived in a deserted Helsinki with her husband.

“In China I was a successful diploma engineer [orig. diplom-i-insinööri, ‘Master of Science in Technology’], here I was nothing. It was hard to accept.”

Since the interviewee is a non-native Finnish speaker, she not only has a foreign accent, but also makes frequent errors in inflection and word choice. However, these features were all “corrected” into standard Finnish in the article (see Appendix). In my English translation, I have not attempted to replicate the incorrect language features.

Example 3B. “Engineer” (Journalistic interview vs. published article)

First of all, the original utterance that the quotation was based on was not an answer to any direct question. This is in contrast to Examples 1 and 2, where the utterances were answers to the journalist’s questions. It is true that the quotation is not even presented or purported to be an answer. However, this does not mean that the quotation could not be an answer, as was demonstrated in Example 2.

In my data, detaching the journalistic interviews conducted for JA from the question-answer structure is very common. For example, in the journalistic interview of Example 3, the journalist’s most recent question (see row 1) was presented almost two minutes earlier. After this question, the interviewee digressed from one topic to another on her own initiative. During this digressing, the journalist did not pose any formal questions, only minor dialogue particles that allowed the interviewee to continue with her turn.

In Example 3, nothing in the article itself offers cues that the quotations would not follow in a more or less verbatim way the original interview discourse. Despite that the published article and the journalistic interview exhibit a number of essential differences, which I will examine in detail in the following paragraphs.

In the interview, the section from which the quotation was later pulled is preceded by a mutual reflection on the importance of language skills and local education for immigrants. As has been argued before, sense-making processes are always dependent on contextual resources (for example, see Linell 2009, 2.5), and thus, the rhetorical function of the to-be-quoted section in the interview can be perceived as an example for the preceding co-text. (In other words, as an answer to a hypothetical question such as can you give an example why these skills are important?) However, in the published article, there is a paragraph leading to the quotation saying that “At Midsummer 1994, Wang’s life changed completely when she arrived in a deserted Helsinki with her husband” (see row 2). This leading paragraph is an obvious primary frame (Goffman 1974) against which the reader will interpret the illocution of the quotation. Thus, the following quotation functions as an illustrative explanation for this “change”. (That is, as an answer to a hypothetical question such as What does it mean that your life “changed completely”? [FOOTNOTE 6] Therefore, due to the monologisation and especially the fact that the quoted discourse is positioned in a new matrix of contexts, the function of this quoted discourse has changed from its original one.

Next, I will focus on the quoted passage. In terms of the intrinsic meaning of the quote (as distinct from its rhetorical function or purpose in language use), the quote virtually paraphrases the stretch of the interview discussion on which it is based (on the left versus the right side of rows 3–5). However, the exact wording is predominately new, which might be due to both the spontaneous nature of the interview and the imperfection of the interviewee’s language skills. Contrary to rows 3 and 4, the latter sentence of the quotation (the right-hand column of row 5) is actually not based on the interviewee’s utterances at all (the left-hand column of row 5). Instead, the sentence is modified after the journalist’s “sympathetic” question (was it a hard situation to accept?), which prompted the interviewee to elaborate on the topic and which was followed by an affirmative answer (yes yes it was). One might even question whether the interviewee would have raised this “issue of acceptance” of her own accord, because when the journalist posed the question, the interviewee was on the verge of beginning her own new speaking turn (if you cannot-), which she then interrupted to answer the journalist’s question instead.
Example 3 contains several aspects that were hidden from the reader by monologising the journalistic interview for JA. Firstly, the interviewee herself introduced the quoted subject matter in the interview without the journalist posing a question or providing any other type of clear initiative. Nothing in the published article referred to such an initiative. Secondly, the evaluative and personal quotation creates an illusion that it was uttered in an independent and continuous way, although it was actually based on both participants’ active, joint production (as in television news production, see Nylund 2006, 216). Additionally, the quotation was framed with a slightly misleading co-text, which further reduces the reader’s possibility to deduce the course of the original interaction.

It is worth pointing out that the monologisation of the above-mentioned features was by no means an mechanical and axiomatic process by which I mean that this original interview discourse – as well as any given interview discourse – could have been monologized in numerous other ways. Thus, in general, the practice of monologisation provides the journalist with substantial means not only for controlling the exploitation of the dialogue and common understanding emerged in the interview, but also for steering the readers’ understanding of the current state of affairs. This is an important point that I will now elaborate and discuss.

5. The social relevance of monologisation practices

Modern societies should have space for competing forces to negotiate socially relevant topics. The importance of monologisation – among other journalistic practices in general and quoting practices in particular – relates to the fact that media are expected to provide that space and serve there both as gatekeepers and discourse moderators (for example, see Ekström 2002, 259; Berger 2007, 209). While the purpose of this paper is not to posit normative claims about what is right or wrong when quoting, I do want to demonstrate the social relevance of the practice of monologisation by citing a strong and topical, recent example.

In the spring of 2015, an alleged (and later substantiated) gang rape occurred in Helsinki, the capital of Finland. A prominent Finnish newspaper quoted a police officer in its website news item in the following way: “The woman was not severely physically injured in this incident.” (orig. “Nainen ei loukkaantunut fyysisesti vakavasti tapahtuneessa.”) The quotation was preceded by a somewhat “neutral” co-text, by which I refer to the text not strongly steering the interpretations of this quotation in any manner. In fact, the same quotation was also used in another news item in the same publication and was preceded there by a different co-text. The inflammatory news item provoked hundreds of comment posts from the readers of this newspaper. In many of them, the comment-writer seized on this very quotation and interpreted it – genuinely or on purpose – as showing that this police officer understated the injuries of the victim and thus diminished rape as a crime.

Based on the results of the research presented in this paper, I became suspicious over the real state of affairs. I contacted the journalist who had interviewed the police officer and co-written the news item. The journalist told me that the quoted utterance was a verbatim reproduction of an answer to his question “Was the victim severely injured?” (However, there was no audio recording of this interview so he had based his article on his hand-written notes.) The journalist also stated that his intention was to quote this utterance in the news item in an unbiased way. “I perceived the answer as neutral, and did not try to make any interpretation of the answer”, he told me in an e-mail. However, due to the monologisation – especially due to the omission of the journalist’s initiative and interrogative role – the news item resulted in the misapprehension by the general public that the police had dismissed this crime as well as the psychological injuries it had probably caused. More generally, this news item might have enhanced the resilient perception that the police dismiss sexual crimes, a perception that turned out to be false, at least on this particular occasion.

Let us speculate for a moment since this question presented to the police officer, regardless of its simplicity, was anything but easy to answer. What really could have the police officer replied on a question “Was the victim severely injured?”? A negative answer – “No, she was not severely injured.” – would have been misleading because it would have neglected the possibility of psychological injuries. On the other hand, neither a positive answer would have worked because the police was not aware of any “severe” injuries at this early stage of the crime investigation. In this light, I argue that the police officer
made his best in commenting on the issue that he had not brought out on his own initiative but as an answer to the question presented to him.

However, the story goes on. The next day, this news item was followed up by a column in the same paper. The columnist, another journalist for the same media, wrote that due to the dismissive attitude reflected in the police officer’s statement, it was hard to keep in mind that “we are not living in the eighteenth century or in India”. This web column – which was read by several superiors before publication, as I was told – immediately received a vast number of shares in social media and the comment section exploded with comments. I assume that if not yet the original news item, this follow-up column at the latest convinced the readers that the interpretation ‘the police dismissed this crime’ were the correct one. Only a few of these commentators eventually challenged how the discussion between the police officer and the journalist had actually emerged in the interview of the first article – which tells about the readers’ unawareness of the monologisation practices. To sum up, the practice of monologisation and the misleading follow-up column substantially affected the public discourse around the discussion of police’s credibility.

6. Conclusion

Traditionally, journalistic interviews are thought to consist of the journalist’s questions and the interviewee’s answers (for example, see Clayman and Heritage 2002, 95). However, as regards journalistic interviews conducted for a journalistic article (for JA) – in contrast to those interviews that are used as sound bites in television news – the reality is much more complex.

Journalistic interviews conducted for JA do not only comprise a series of adjacent pairs of questions and answers, but also the interviewees themselves often take the initiative roles in interview conversations. Furthermore, in addition to posing questions, the journalists also engage in the interview firstly by using various responsive devices (such as um, yeah, okay) to prompt the interviewee to continue her turn, and secondly, by using longer follow-ups (for instance, in Example 3: was it a hard situation to accept) to prompt the interviewee to elaborate on the topic (cf. O’Keeffe 2006, 46, who summarises the research on [the lack of] responses in broadcast news interviews.). As a matter of fact, journalistic interviews conducted for JA possess numerous characteristics of mutuality and equality that have traditionally been associated with mundane conversations (see Heritage 1998, 7). Naturally, one must consider that the equality between the journalist and the interviewee as partners of interaction is maintained within the interview situation itself. Quite contrary, at a macro level, the journalist, together with other editorial staff – excluding the interviewees – are the ones who have the control over selecting the subject matter under consideration, arranging the interview situation, and deciding the exploitation of the interview as a raw material for a journalistic output. [FOOTNOTE 7]

Within the institutional context described above, monologisation refers to a particular aspect of making quotations for the article in which the journalist predominantly eliminates the role that s/he had in the co-adaptive interview interaction. Thus, monologisation makes the direct quotations appear as though they were originally unprompted and continuous utterances by the interviewee, and this outcome can modify and even distort the original meaning of the quoted discourse and also result in the reader’s severe misapprehension of the statements assigned to the interviewee, as we saw especially in Section 5. [FOOTNOTE 8]

As this paper has shown, purpose-oriented simplification of the interaction is, on the one hand, an effective means for controlling, steering and even distorting the message of the interviewee, and on the other hand, a means for incorporating the journalist’s subjective points of view in the article without breaking the “ideological rule” that journalism must disseminate impartial knowledge and separate facts from opinions (Van Dijk 1991, 192). At the same time, monologisation is an important part in the performance of journalistic professionalism: For example, Eriksson and Östman have demonstrated (2013, 319–321) that journalists’ cooperativeness towards political actors within the interactional phase (= interviewing) often changes into adversarialness within the news-construction phase (= writing), and they have drawn a conclusion that while it makes sense for journalists “to seek information more than confrontation” (319) when interacting with their politician sources, the adversarial stance adopted in publicly accessible phases of the news production, in turn, indicates to the audience the journalists’ commitment to their highly ranked ideal of watchdog-role (see also Reich 2006). Since monologisation is not an axiomatic process but consist of a series of deliberate decision-makings, its situation-dependent practices and goals need further research and also call for an ethical consideration of journalistic practices.
Finally, the notion of monologisation is essential also from the readers’ perspective: Readers who are not provided with solid and unambiguous information regarding the original interactional co-text and context are not able to interpret the quotation so that they understand what the quoted discourse essentially meant in the interview. And since I argue that a question of the truthfulness of quotations and journalism in general is – to a great extent – a question of the transparency of the principles of work practices, to become aware of monologisation as a fundamental journalistic practice is the key to a critical reading of the media of our time.

NOTES

[FOOTNOTE 1] Outside media studies, a somewhat similar phenomenon has been discussed, especially in connection with police interrogations (for example, see Jönsson & Linell 1991; Komter 2006; Van Charldorp 2014), but also in contexts such as parliament records (Slembrouck 1992) and therapy (Ravotas & Berkenkotter 1998).

[FOOTNOTE 2] It is worth pointing out that within all the literature concerning press conferences, news interviews and television news sound bites, the greatest attention thus far has been devoted to interviews dealing with politics (e.g., Ekström & Petrona 2011, 1). As Montgomery has noted (2007, 147), the whole genre and practice of news interviews have been defined by "one sub-type", although its primacy "is neither supported by the history of the journalistic interview nor justified by a survey of current broadcasting practice".

[FOOTNOTE 3] "Gathering" is, of course, a simplifying conceptualisation. As Nylund (2011, 488) has argued, a "[journalistic] interview is more about generating and constructing knowledge, rather than simply gaining or collecting it".

[FOOTNOTE 4] The inconsistency between the number of recordings and the number of articles results from the fact that there are two journalists in the data set who wrote an article on the same press conference.

[FOOTNOTE 5] A video recording might reveal possible nonverbal communication by the journalist. However, videotaping would have undesirably influenced the interview, and was therefore not included in my data collection.

[FOOTNOTE 6] As a matter of fact, the "Midsummer 1994" issue is also discussed in the interview, but approximately five minutes earlier than the section transcribed above.

[FOOTNOTE 7] It has been argued that these fundamental decisions are influenced by factors such as the publishers’ ideological values and purposes, the financial basis of the publication, the needs and interests of the audience, and, on a grander scale, the current journalistic culture and the societal context in which publishing takes place in general (Haapanen in press 2016a; Helle 2010; Kang 2007; Kuo 2007).

[FOOTNOTE 8] I have also demonstrated elsewhere that besides quotations, a substantial part of other text material in journalistic articles is often based on information that has been abstracted from an interviewee. When this occurs, the monologisation practice can actually be conceived of as occurring the other way round: now the interview’s interactive turn exchange is presented merely as the journalist’s independent text without attribution to its co-adaptive origin (Haapanen 2016). However, this procedure is outside the scope of this article.
